Quiz on PHP Variable Types

1. Which of the following is NOT a basic variable type in PHP?

A. String

B. Integer

C. Character

D. Boolean

Answer (C): Character
PHP does not have a separate character type; characters are represented as strings.

2. What type of variable is used to store decimal numbers in PHP?

A. Integer

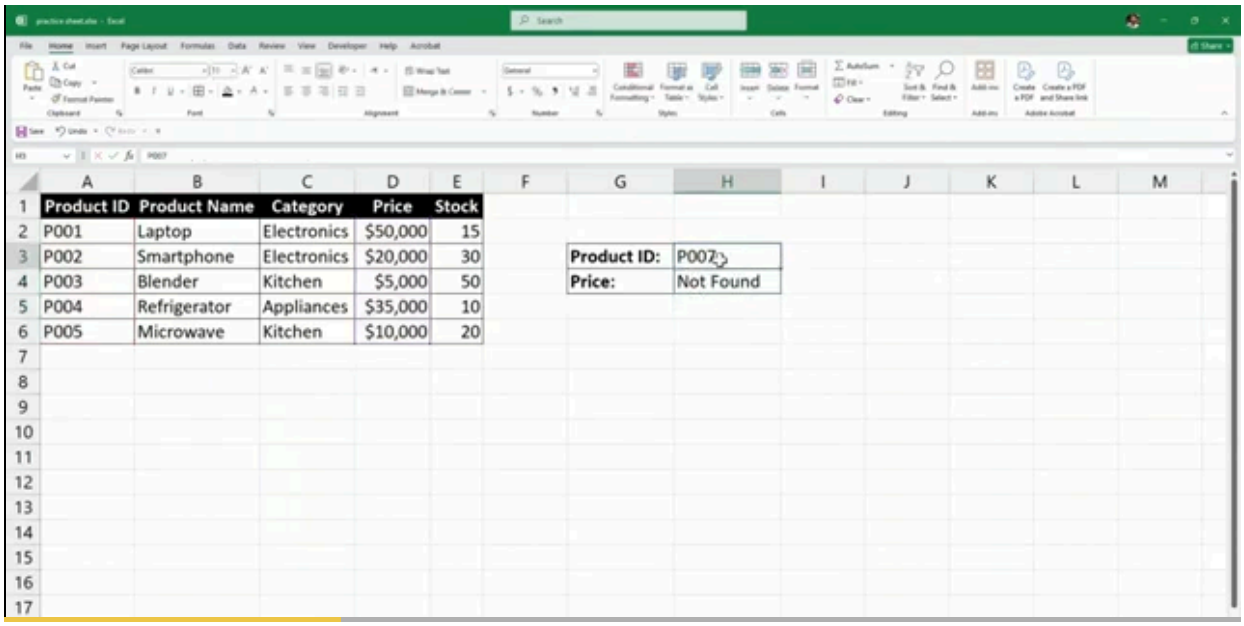
B. Float

C. Boolean

D. String

Answer (B): Float
Float variables are used to store decimal numbers in PHP.

Advertisement



Product ID	Product Name	Category	Price	Stock
P001	Laptop	Electronics	$50,000	15
P002	Smartphone	Electronics	$20,000	30
P003	Blender	Kitchen	$5,000	50
P004	Refrigerator	Appliances	$35,000	10
P005	Microwave	Kitchen	$10,000	20

Product ID:	P007
Price:	Not Found

3. How do you declare a variable in PHP?

A. $variable_name

B. variable_name$

C. var variable_name

D. @variable_name

4. What will be the output of the following code: $a = '5'; echo $a + 2;

A. 5

B. 7

C. 52

D. Error

Answer (B): 7

PHP performs type juggling, so it converts string '5' to integer 5 and adds 2.

5. Which variable type would you use to represent true or false values?

A. Integer

B. Float

C. Boolean

D. String

Answer (C): Boolean

Boolean variables are specifically used to represent true or false values in PHP.

You scored 5 out of 5!
